

### Non-Parametric

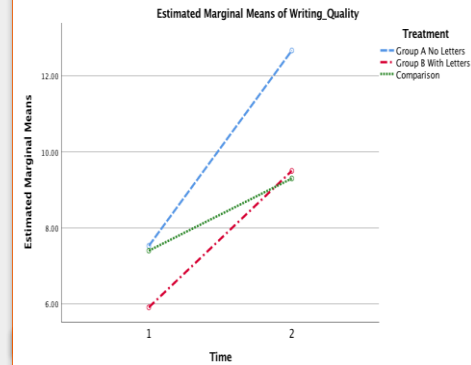

Knowledge of sentence type scores were not correlated to paragraph writing quality on pre-test ( $r = .276, n = 10, p = .44$ ) nor on post-test ( $r = .305, n = 10, p = .392$ ). Friedman's ANOVA non-parametric analysis showed a significant difference between the pre-, mid-, & post-test mean scores ( $\chi^2 = 6.5, p = .04$ ). Wilcoxon signed rank post hoc testing revealed no significant differences from pre- to mid-intervention scores ( $z = 1.562, p = .118$ ) nor from mid- to post-intervention ( $z = 1.511, p = .131$ ).

## Reverse Engineering Expository

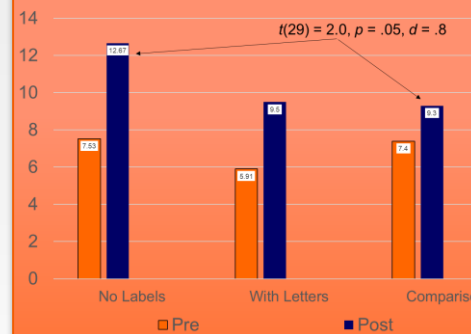

Paragraph Writing Instruction: Group design with parametric & non-parametric analyses.

### Parametric

$F(2, 39) = .863, p = .43, \text{partial } \eta^2 = .042, \beta = 81.2\%$
